Disclaimer

PLANET Technology does not warrant that the hardware will work properly in all environments and applications, and makes no warranty and representation, either implied or expressed, with respect to the quality, performance, merchantability, or fitness for a particular purpose. PLANET has made every effort to ensure that this User's Manual is accurate; PLANET disclaims liability for any inaccuracies or omissions that may have occurred.

Information in this User's Manual is subject to change without notice and does not represent a commitment on the part of PLANET. PLANET assumes no responsibility for any inaccuracies that may be contained in this User's Manual. PLANET makes no commitment to update or keep current the information in this User's Manual, and reserves the right to make improvements to this User's Manual and/or to the products described in this User's Manual, at any time without notice.

If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at whose own expense.

CE Mark Warning

This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

Energy Saving Note of the Device

This power required device does not support Standby mode operation.

For energy saving, please remove the power cable to disconnect the device from the power circuit.

Without removing power cable, the device is will still consuming power from the power source. In the view of Saving the Energy and reduce the unnecessary power consuming, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

Revision

1. INTRODUTION

The PLANET GEPON OLT – EPL-2000 is GEPON Optical Line Terminal (OLT) which designed with two GEPON port, two Gigabit SFP Interfaces and one management port. Terms of "GEPON OLT" means the OLT mentioned titled in the cover page of this User's manual.

1.1 Packet Contents

Open the box of the GEPON OLT and carefully unpack it. The box should contain the following items:

Check the contents of your package for following parts:

Ø	The GEPON OLT	x1
V	The MGB-PX20 SFP Transceivers	x2
V	User's Manual CD	x1
V	Quick Installation Guide	x1
V	19" Rack Mount Accessory Kit	x1
☑	AC Power Cord	x1

If any of these are missing or damaged, please contact your dealer immediately, if possible, retain the carton including the original packing material, and use them against to repack the product in case there is a need to return it to us for repair.

1.2 Product Description

Perfectly Designed for FTTx Applications

PLANET EPL-2000 is a GEPON **Optical Line Terminal (OLT)** which designed with two GEPON ports, two Gigabit SFP Interfaces and one management port. It is easy installation and maintenance for GEPON deployment. Applications with PLANET GEPON **Optical Network Units (ONU)** EPN series, PLANET EPL-2000 can provide highly effective GEPON solutions and convenient management for Broadband network. PLANET GEPON technology provides the high bandwidth up to 1.25Gbps for both upstream and downstream, up to 20km Long-Distance Coverage between equipment nodes, Scalability and Flexibility for network deployment. It is a cost-effective access technology with reliable and scalable network for Triple-play service applications.

High Speed Connectivity for ISP / Triple Play Devices

With growing network services such as HDTV, IPTV, voice-over-IP (VoIP) and Multimedia broadband applications, and the demand of broadband rises quickly. The present Broadband environment has not already accorded with needing; however, **Passive Optical Network (PON)** would be the most promising NGN (Next Generation Networking) technology to fulfill the demand.

Robust Layer 2 Features

With high split ratio at 1:64 and supports the usage of PLANET ONUS, EPL-2000 can minimize the investment cost for carriers. By using the advanced technology in the telecommunication industry, the EPL-2000 will provide strong functionalities for Ethernet features such as VLAN, Multicast, DBA (Dynamic Bandwidth Allocation), and Access Control List. The EPL-2000 is an ideal solution for FTTx applications.

GEPON is a point to multipoint communications protocol based on Gigabit Ethernet. It allows a Gigabit Ethernet communications fiber to be shared by multiple end users using a passive optical splitter. GEPON communication takes place between an Optical Line Terminal (OLT) and multiple Optical Network Units (ONUs). Using standard terminology, downstream traffic flows from OLT to ONU, and upstream traffic flows from ONU to OLT. A protocol called Multi Point Control Protocol (MPCP) is used to arbitrate the channel between the ONU's so that no collisions will occur on the common fiber.

1.3 How to Use This Manual

This User Manual is structured as follows:

Section 2, Hardware INSTALLATION

The section explains the functions of the Switch and how to physically install the GEPON OLT.

Section 3, EMS Utility INSTALLATION

The section contains the information about how to install EMS Utility.

Section 4, EMS Utility CONFIGURATION

The section explains how to manage the GEPON OLT by EMS Utility.

Section 5, SWITCH OPERATION

The chapter explains how to does the switch operation of the GEPON OLT.

Appendix A

The section contains cable information of the GEPON OLT.

1.4 Product Features

GEPON Port

- 2 x SC type GEPON OLT Port
- Up to 1.25Gbps Upstream and Downstream
- Up to 20Km maximum distance
- Each OLT port supports up to 64 ONUs
- Fully compliant with IEEE 802.3ah
- Point-to-multipoint network topology
- LED indicators for link status

Uplink and Management Port

- 2 x 1000Base-SX/LX SFP Interface
- Up to 120Km maximum distance
- 1 x 10/100Base-TX RJ-45 management port

Layer 2 Features

- Dynamic bandwidth allocation (DBA) support
- Support VLAN
 - IEEE 802.1Q Tagged VLAN
 - Up to 255 VLAN groups, out of 4094 VLAN ID
- Support up to 8K MAC Address Table
- Enhanced IGMP features
- Support Link Aggregation on two uplink ports

OLT Management

- User-Friendly GUI Management
- Up to 32 OLTs management through single GUI
- SNMP v1 / v2c monitoring
- Three users levels control
- 2 control interfaces
 - Out-Band IP- the Management RJ port
 - In-Band IP the two uplink ports
- Support ONU authentication, avert illegal ONUs access to network
- Event message logging to system log
- SNMP trap for alarm notification

ONU Management

- IEEE 802.1w Rapid Spanning Tree
- ONU Port control
- ONU Loopback test
- ONU IGMP Snooping
- ONU Layer 3 Access Control List (ACL)

1.5 Product Specification

Product		EPL-2000
Hardware	Specification	
Transmissi	ion speed	Downstream: 1.25 Gbps Upstream: 1.25 Gbps
Optical spl	it ratio	Up to 1:64
	Uplink Port	2 x 1000Base-X SFP slot
Port	PON Port	2 x PON Port
	MGMT Port	1 x RJ-45 (10/100Base-TX)
LED Indicators		1 x Power LED 1 x System LED 4 x Uplink Port LED (ACT and Link) 2 x PON LED (Link)
EMS Utility	Specification	
Switch Fea	iture	MAC address learning and binding MAC Filtering Supports IGMP Proxy Support the VLAN division on the basis of port Up to 4096 VLAN support 8K MAC Addresses support ONU Service Level Agreement (SLA) support ONU Remote loop-back test ONU IGMP Snooping ONU Port Management
Manageme	nt	User-Friendly GUI Utility Firmware and Configuration upgradeable via Utility Remote ONU Management
Standards	Conformance	
Safety		FCC Part 15 Class A, CE
Standards Compliance		IEEE 802.3 10Base-T IEEE 802.3u 100Base-TX IEEE 802.3z Gigabit SX/LX IEEE 802.3x Flow Control and Back pressure IEEE 802.1w Rapid spanning tree protocol IEEE 802.1Q VLAN Tagging
Environme	ent Specification	
Dimension	(W x D x H)	441 x 206 x 44mm
Weight		2.31kg
Power		100 – 250V AC
Temperatu	re	Operating temperature: 0 ~ 50 Degree C Storage temperature: -30 ~ 60 Degree C
Humidity		Operating Humidity: 10 ~ 90% non-condensing Storage Humidity: 5 ~ 95% non-condensing

2. HARDWARE INSTALLATION

This section describes the hardware features and installation of the GEPON OLT on the desktop or rack mount. For easier management and control of the GEPON OLT, familiarize yourself with its display indicators, and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the GEPON OLT, please read this chapter completely.

2.1 Hardware Description

2.1.1 OLT Front Panel

The unit front panel provides a simple interface monitoring the OLT. Figure 2-1 shows the front panel of the GEPON OLT.

EPL-2000 Front Panel

2-Port GEPON OLT			
	Console Manager	Uplink Port	
$\bigcirc \oplus$	R5485		
EPL-2000	Doctor (See	1000X 1000X	

Figure 2-1 EPL-2000 Front Panel

RS-485 and RJ-45 Console Connector

This is just for Manufacturer Technical Use

Reset button

The reset button is designed for reboot the GEPON OLT without turn off and on the power. The following is the summary table of Reset button functions:

Reset Button Pressed and Released	Function
System reboot	Reboot the GEPON OLT

Management Port

10/100Base-TX Copper, RJ-45 Twist-Pair: Up to 100 meters

Gigabit SFP Uplink Slots

1000Base-SX/LX mini-GBIC slot, SFP (Small Form Factor Pluggable) transceiver module: From 550 meters (Multi-mode fiber), up to 10/30/50/70/120 kilometers (Single-mode fiber).

GE1 & GE2 Gigabit SFP uplonk slots support **1000Mbps Forced Mode** only. The remote Gigabit switch or Media Converter's SFP Port must support 1000Mbps Forced Mode as well.

Gigabit SFP PON Slots

1000Base-PX20 mini-GBIC slot, SFP (Small Form Factor Pluggable) transceiver module: up to 20 kilometers (Single-mode fiber).

2.1.2 LED Indications

The front panel LEDs indicates instant status of port links, data activity and system power; helps monitor and troubleshoot when needed. Figure 2-2 shows the LED indications of these GEPON OLT.

EPL-2000 LED Indication

Figure 2-2 EPL-2000 LED Panel

System

LED	Color	Function
PWR	Green	Lights: To indicate that the Switch is powered on.
eve	Groop	Blink: The OLT is ready for management
515	Green	OFF: The OLT is abnormal system operation

■ 1000Base-SX/LX SFP interfaces (GE1 and GE2 Port)

LED	Color	Function	
	Green	Lights: To indicate the link through that SFP port is successfully established.	
LINK Green		OFF: To indicate that the SFP port is link down.	
АСТ	Green	Blink: To indicate that the switch is actively sending or receiving data over that port.	

■ 1000Base-PX20 SFP PON interfaces (PON1 and PON2 Port)

LED	Color	F	unction
		ights: To indicate the link through that P	ON port is successfully established.
LINK	Green	ff: To indicate that the PON port is li	nk down.

2.1.3 OLT Rear Panel

The rear panel of the GEPON OLT indicates an AC inlet power socket, which accepts input power from 100 to 250V AC, 50-60Hz. Figure 2-3 shows the rear panel of this GEPON OLT.

EPL-2000 Rear Panel

AC Power Receptacle

For compatibility with electric service in most areas of the world, the GEPON OLT's power supply automatically adjusts to line power in the range 100-250VAC and 50/60 Hz.

Plug the female end of the power cord firmly into the receptable on the rear panel of the GEPON OLT. Plug the other end of the power cord into an electric service outlet then the power will be ready.

There is a power switch that is for AC power input using only. As DC power input has no power switch.

The device is a power-required device; if your networks should active all the time, please consider using UPS (Uninterrupted Power Supply) for your device. It will prevent you from network data loss or network downtime.

In some area, installing a surge suppression device may also help to protect your GEPON OLT from being damaged by unregulated surge or current to the Switch or the power adapter.

2.2 Install the OLT

This section describes how to install your GEPON OLT and make connections to the GEPON OLT. Please read the following topics and perform the procedures in the order being presented. To install your GEPON OLT on a shelf, simply complete the following steps.

2.2.1 Rack Mounting

To install the GEPON OLT in a 19-inch standard rack, please follows the instructions described below. **Step1:** Place the GEPON OLT on a hard flat surface, with the front panel positioned towards the front side. **Step2:** Attach the rack-mount bracket to each side of the GEPON OLT with supplied screws attached to the package.

Figure 2-4 shows how to attach brackets to one side of the GEPON OLT.

Figure 2-4 Attach Brackets to the GEPON OLT.

You must use the screws supplied with the mounting brackets. Damage caused to the parts by using incorrect screws would invalidate the warranty.

Step3: Secure the brackets tightly.

- Step4: Follow the same steps to attach the second bracket to the opposite side.
- Step5: After the brackets are attached to the GEPON OLT, use suitable screws to securely attach the brackets to the rack, as shown in Figure 2-5.

Figure 2-5 Mounting the GEPON OLT on a Rack

2.2.2 Installing the SFP transceiver

The sections describe how to insert an SFP transceiver into an SFP slot.

The SFP transceivers are hot-pluggable and hot-swappable. You can plug-in and out the transceiver to/from any SFP port without having to power down the GEPON OLT. As the Figure 2-6 appears.

Figure 2-6 Plug-in the SFP Transceiver

■ Approved PLANET SFP Transceivers

PLANET GEPON OLT supports both Single mode and Multi-mode SFP transceivers. The following list of approved PLANET SFP transceivers is correct at the time of publication:

1000Base-X SFP modules:

- MGB-SX SFP (1000BASE-SX SFP transceiver / Multi-mode / 850nm / 220m~550m)
- MGB-LX SFP (1000BASE-LX SFP transceiver / Single mode / 1310nm / 10km)
- MGB-L30 SFP (1000BASE-LX SFP transceiver / Single mode / 1310nm / 30km)
- **MGB-L50** SFP (1000BASE-LX SFP transceiver / Single mode / 1310nm / 50km)
- MGB-LA10 SFP (1000BASE-LX SFP transceiver / WDM Single mode / TX: 1310nm, RX: 1550nm/ 10km)
- MGB-LB10 SFP (1000BASE-LX SFP transceiver / WDM Single mode / TX: 1550nm, RX: 1310nm / 10km)
- MGB-TSX SFP (1000BASE-SX SFP transceiver / Multi-mode / 850nm / 220m ~550m; -40~75°C)
- MGB-TLX SFP (1000BASE-SX SFP transceiver / Signle mode / 1310nm / 10km; -40~75°C)
- MGB-TL30 SFP (1000BASE-SX SFP transceiver / Signle mode / 1310nm / 30km; -40~75°C)
- MGB-TL70 SFP (1000BASE-SX SFP transceiver / Signle mode / 1310nm / 70km; -40~75°C)

Due to GEPON OLT EPL-2000 SFP Port of GE1 & GE2 are configured as 1000Mbps Forced Mode. If want to make the connection establish successfully, the switch's SFP Port should also change to be 1000Mbps Forced Mode. Otherwise, the connection might Link Fail.

Before connect the other GEPON OLT, workstation or Media Converter.

- Make sure both side of the SFP transceiver are with the same media type, for example: 1000Base-SX to 1000Base-SX, 1000Base-LX to 1000Base-LX.
- 2. Check the fiber-optic cable type match the SFP transceiver model.
 - To connect to 1000Base-SX SFP transceiver, use the Multi-mode fiber cable- with one side must be male duplex LC connector type.
 - To connect to 1000Base-LX SFP transceiver, use the Single-mode fiber cable-with one side must be male duplex LC connector type.

■ Connect the fiber cable

- 1. Attach the duplex LC connector on the network cable into the SFP transceiver.
- 2. Connect the other end of the cable to a device switches with SFP installed, fiber NIC on a workstation or a Media Converter..
- Check the LNK/ACT LED of the SFP slot on the front of the GEPON OLT. Ensure that the SFP transceiver is operating correctly.
- 4. Check the Link mode of the SFP port if the link failed. Co works with some fiber-NICs or Media Converters, set the Link mode to "1000 Force" is needed.

Remove the transceiver module

- 1. Make sure there is no network activity by consult or check with the network administrator. Or through the management interface of the switch/converter (if available) to disable the port in advance.
- 2. Remove the Fiber Optic Cable gently.
- 3. Turn the handle of the MGB module to horizontal.
- 4. Pull out the module gently through the handle.

Figure 2-8 Pull out the SFP Transceiver

Never pull out the module without pull the handle or the push bolts on the module. Direct pull out the module with violent could damage the module and SFP module slot of the GEPON OLT.

3. MANAGEMENT SOFTWARE INSTALLATION

This chapter explains the methods that you can use to configure management access to the GEPON OLT. It describes the types of management applications and the communication and management protocols that deliver data between your management device (workstation or personal computer) and the system. It also contains information about port connection options.

This chapter covers the following topics:

- Requirements
- Management Access Overview
- MySQL Installation
- EMS Utility Installation
- SNMP Access

3.1 Requirements

The GEPON OLT provides a GUI utility to manage the system; the following equipments are necessary for further management.

- Subscriber PC installed with Ethernet NIC (Network Card)
- MySQL Software (Windows Platform)
- **EMS** Software (Windows Platform)
- Management Port connects
 - Network cables use standard network (UTP) cables with RJ45 connectors
- PON Port connects
 - Fiber Transceiver Slot with a 1000Base-PX20 SFP PON transceiver
 - Fiber cable Using single mode of Fiber (SC) cable

3.2 Management Access Overview

The GEPON OLT EPL-2000, supports 10/100Mbps Management interface and two 1000Base-X net interfaces for TCP/IP-Based GUI Management. The GEPON OLT gives you the flexibility to access and manage it using any or all of the following methods:

- EMS (Element Management System) Utility
- An external SNMP-based network management application

Each of these management methods has their own advantages. Table 3-1 compares the two management methods.

Method	Advantages	Disadvantages
EMS Utility	Ideal for configuring the EPL-2000	Can't remote control over etherent
	Compatible with most of popular	
	Windows Base System	
	Most visually appealing	
SNMP Agent	Communicates with switch functions at	Requires SNMP manager software
	the MIB level	Least visually appealing of all three methods
	Based on open standards	Some settings require calculations
		Security can be compromised (hackers need
		only know the community name)

Table 3-1 Management Methods Comparison

3.3 EMS Utility Management

The **EMS (Element Management System)** Utility comes with sophisticated software Graphical User Interface (GUI). It is highly intuitive and allows the user to control the GEPON and set such things as SLAs, bridging and VLAN modes, static table entries, and to perform firmware upgrades etc. It is found in the Utility folder on the CD provided. There are to softwares need to be installing in your management PC:

- Microsoft MySQL Server
- EMS Utility

To install and use the GUI, do the following two sections.

3.3.1 MySQL Server Installation

- 1. Insert the bundled CD disk into the CD-ROM drive to launch the autorun program. Once completed, a welcome menu screen will appear. Click the "**MySQL**" hyperlink, the below InstallShield Wizard dialog box will appear.
- 2. Once the Setup program starts running, please click "Next" button for starting installation.

Figure 3-2 MySQL Installation Screen

3. The Setup Type window appears, the default is "**Typical**" mode. Please clicks "**Next**" button.

3.3.2 EMS Utility Installation

- Insert the bundled CD disk into the CD-ROM drive to launch the autorun program. Once completed, a welcome menu screen will appear. Click the "PL-EMS" hyperlink, the below InstallShield Wizard dialog box will appear.
- 2. Once the Setup program starts running, please click "Next" button for starting installation.

Figure 3-19 PL-EMS Setup Wizard screen

3. During the installation, it will ask for the place to put the PL_EMS folder. The default is C:\Program Files\PLANET\EMS\.

Figure 3-20 PL-EMS folder installation screen

4. Clicks "**Install**" for starting installation.

Figure 3-21 PL-EMS Installation screen

5. Clicks "Finish" button for completing the EMS Setup.

Figure 3-22 PL-EMS Installation Completing screen

6. Finish the PL-EMS installation, the desktop will appear two icons;

PL Server and PL Client.

3.3.3 Start PLANET EMS Management

The following shows how to startup the PL-EMS Management on the management PC.

1. Double Click the **PL Server** icon on the PC desktop. After couple of seconds, the lower-right corner of system tray will appear EMS icon.

Figure 3-23 PL Server Icon

Double clicks the PL Client icon on the PC desktop, it will pop-up a window to enter the User name and Passwords.
 Please enter the default User name "admin" and Password "admin". The login screen in Figure 3-24 appears.

Figure 3-24 PL Client Icon and Login Window

3. After entering the User name and Password, the PL-EMS main screen appears as Figure 3-25.

Figure 3-25 Main Screen of EPL-2000 GEPON OLT

3.4 SNMP-Based Network Management

You can use an external SNMP-based application to configure and manage the GEPON OLT, such as SNMPc Network Manager, HP Openview Network Node Management (NNM) or What's Up Gold. This management method requires the SNMP agent on the switch and the SNMP Network Management Station to use the **same community string**. This management method, in fact, uses two community strings: the **get community** string and the **set community** string. If the SNMP Net-work management Station only knows the set community string, it can read and write to the MIBs. However, if it only knows the get community string, it can only read MIBs. The default gets and sets community strings for the GEPON OLT are public.

Figure 3-26 SNMP Management Diagram

4. EMS Management System

The PLANET GEPON solution, including the OLT EPL-2000 and ONUs - EPN-102 and EPN-103. For inconvenience, following information will introduce the software configuration.

This document explains how to use the EMS Utility, for the purpose of evaluating the functionality and usability of Host Interface Protocol. This manual assumes that the reader has a technical background and a base level of understanding regarding the basic operation of PON equipment. The EMS Utility is a demonstration package, intended for evaluation purposes only.

Organization of the EMS Utility

The screen real estate used by the EMS Utility is divided into three sash windows and one EMS Toolbar.

- The upper left panel displays the entities that may be managed by the Host Interface, including the OLT, ONUs and Logical Links. This sash window shall be referred to as the Element Status Window.
- Left clicking on an entity with the mouse will open a tabbed panel in the upper right sash window that may be used to manage the entity. This sash window shall be referred to as the Entity Management Window.
- The bottom sash window is used for the purpose of logging the host interface message that are sent and received by the EMS Utility, and shall be referred to as the Message Log.

If the OLT is running normally and the ONUs register each of their LLIDs, you should see something similar to the figure. The left hand pane shows the MAC addresses of the OLT and the ONU's LLIDs. Depending on the number of ONUs, LLIDs, MAC addresses etc you may see something slightly different. If the GUI fails to connect to the OLT, check the IP addresses of the Host PC and the management port. Make sure you can ping the IP address assigned to the management port or uplink port. Also verify that the Host and management IP addresses match in the GUI's Utilities.

4.1 EMS Toolbar

The toolbar includes System, Alarm, Config, Performance and Help features which allows users to do advanced setting.

Figure 4-1 EPL-2000 GEPON OLT Toolbar

4.1.2.4 Trap Window

This function displays the EPL-2000 trap; include Severity, Handler, Trap Object and more.

🍰 In	🖆 Traps						
Clear	Severity	Handler	Trap Object	NE IP Address	Time	Resume Time	Descript
	Minor	admin		/127.0.0.1:1928	11/05/2012 12:10:11		A user try to use account as admin to login, but authority fail.
	Minor	admin		/127.0.0.1:1928	11/05/2012 12:10:16		A user try to use account as admin to login, but authority fail.

4.1.3 Config

This feature allows user to configure the Top Tree, EPL-2000, PON Card and ONU property.

Figure 4-12 Toolbar of Config screen

Object	Description
Add:	Allows user to add Location and Device
Modify:	Allows user to modify the property of Devices like: EPL-2000 and PON Card.
Delete:	Allows user the delete the Devices.
Change Map:	Allows user to change the background Map.
Upload:	Allows user to upload new Map.
Device Unameder	Allows user to upgrade firmware for EPL-2000 or ONU
Device Upgrade:	For more detail, please refer to Chapter 4.5 "How to upgrade EPL-2000"

4.1.4 Performance

This performance function helps user to verify the OLT connection. This window allows user to issue ICMP PING packets to troubleshoot IP connectivity issues.

Once you select the target OLT in the Top Tree and click Perofmance\Ping from the Tool bar, ICMP packets are transmitted. The report windows popup automatically until responses to all packets are received, or until a timeout occurs. The Ping screen in Figure 4-13 appears.

Figure 4-13 Toolbar of Perofrmance screen

Be sure the target OLT's IP Address is within the same network subnet of the EMS workstation, or you had setup the correct gateway IP address.

4.1.5 Help

Allows user to change the color of window and lauange.

4.2 OLT Management

To manage EPL-2000, EMS manager needs to add EPL-2000 device. They can add and management the EPL-2000 from the two types of interfaces:

- Management Port the 10/100Base-TX RJ-45 interface
- Uplink ports the two 1000Base-X SFP interfaces

The EPL-2000 is shipped with default IP addresses as following.

Management Port: IP Address: 192.168.1.10			
	Subnet Mask: 255.255.255.0		
Uplink Ports:	IP Address: 192.168.10.10		
	Subnet Mask: 255.255.255.0		

Clicks the Right mouse button on Top Tree and clicks [Add Device] in the interface, you will find the picture as follow:

Write Community:	Indicates the community write access string to permit access to SNMP agent.		
Trap Receiver	Assign IP address of host to receive trap from the device.		

1~4 IP Address:				
	Three switch modes explanation is as follows:			
	Normal Mode(Normal):			
	This is OLT board's default working mode including 2 uplink GE ports and 2 PON			
	networking sideline port compliant with 802.1 switch. In this mode, PON			
	networking's user data could reach any one of 2 GE uplink ports.			
	Port Designated Mode (sniDestinated)			
Switch Mode	Under this mode, user should choose one fixed GE port as uplink port .All PON's			
Switch Mode.	networking data could be connected with uplink networking through this port.			
	When the switch mode is set port mode as sniDestinated, one of these 2 uplink			
	ports must be used as uplink port.			
	Transparent Transmission Mode(transparent)			
	Under this mode, 2 PON ports and 2 uplink GE ports are trunk ,meaning PON			
	port 1(OLT) correspond with GE1, PON port 2 correspond with GE2 .The case is			
	the same with other PON ports .			

4.2.3 Net Interface Management

The system support two IP ports: in-band IP and out-band IP ports.

Example: In-band IP makes up with "MgtW". MgtW is the only in-band IP port. Out-band IP is composed with "MgtL". MgtL is the only one out-band IP port. Change the parameters, users can change in-band IP, MgtW's IP address, mask, broadcasting IP address, enable or disable in-band IP management port compellingly.

VLAN[1~4094]	Default VLAN ID: 1
Shut Down:	Two options: Operational or Shut Down mode.

4.2.4 Trunk Management

Trunk Management optimizes port usage by linking 2 GE ports together to form a single Link Aggregated Groups (LAGs). Trunk multiplies the bandwidth between the devices, increases port flexibility, and provides link redundancy.

Due to GEPON OLT EPL-2000 SFP Port of GE1 & GE2 is configure as 1000Mbps Forced Mode. If want to make the connection establish successfully, the switch's SFP Port should also change to be 1000Mbps Forced Mode. Otherwise, the connection might Link Fail.

4.2.5 VLAN Management

4.2.5.1 VLAN Overview

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLAN also logically segment the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily. VLAN can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains.

IEEE 802.1Q Standard

IEEE 802.1Q (tagged) VLAN are implemented on the Switch. 802.1Q VLAN require tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLAN allow a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLAN can also provide a level of security to your network. IEEE 802.1Q VLAN will only deliver packets between stations that are members of the VLAN. Any port can be configured as either **tagging** or **untagging**.:

- The untagging feature of IEEE 802.1Q VLAN allows VLAN to work with legacy switches that don't recognize VLAN tags in packet headers.
- The tagging feature allows VLAN to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

Some relevant terms:

- Tagging The act of putting 802.1Q VLAN information into the header of a packet.
- Untagging The act of stripping 802.1Q VLAN information out of the packet header.

802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of **0x8100** in the Ether Type field. When a packet's Ether Type field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI - used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of **VLAN ID (VID)**. The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLAN can be identified.

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

The Ether Type and VLAN ID are inserted after the MAC source address, but before the original Ether Type/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

Adding an IEEE802.1Q Tag

Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLAN to span network devices (and indeed, the entire network – if all network devices are 802.1Q compliant).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the switch. If no VLAN are defined on the switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLAN are concerned. Tagged packets are forwarded according to the VID contained within the tag. Tagged packets are also assigned a PVID, but the PVID is not used to make packet forwarding decisions, the VID is.

Tag-aware switches must keep a table to relate PVID within the switch to VID on the network. The switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VID are different the switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VID as the switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

Default VLANs

The Switch initially configures one VLAN, VID = 1, called **"default."** The factory default setting assigns all ports on the Switch to the **"default"**. As new VLAN are configured in Port-based mode, their respective member ports are removed from the "default."

Assigning Ports to VLANs

Before enabling VLANs for the switch, you must first assign each port to the VLAN group(s) in which it will participate. By default all ports are assigned to VLAN 1 as untagged ports. Add a port as a tagged port if you want it to carry traffic for one or more VLANs, and any intermediate network devices or the host at the other end of the connection supports VLANs. Then assign ports on the other VLAN-aware network devices along the path that will carry this traffic to the same VLAN(s), either manually or dynamically using GVRP. However, if you want a port on this switch to participate in one or more VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, then you should add this port to the VLAN as an untagged port.

Tagged and Untagged

Every port on an 802.1Q compliant network device can be configured as tagged or untagged.

- Tagged: Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into those ports. If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. The VLAN information in the tag can then be used by other 802.1Q compliant devices on the network to make packet-forwarding decisions.
- Untagged: Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

Frame Income Frame Leave	Income Frame is tagged	Income Frame is untagged
Leave port is tagged	Frame remains tagged	Tag is inserted
Leave port is untagged	Tag is removed	Frame remain untagged

4.2.5.2 VLAN Configuration

To completely configure the VLAN functions on the GEOPN OLT, two of the following sub-menus are need to be well configured.

- OLT Management \ VLAN Management
- OLT Management \ Port \ Port Property

OLT Management \ VLAN Management

This page is used for configuring the OLT port VLAN. The VLAN Management page contains fields for managing ports that are part of a VLAN.

Port ID:	This is the logical port name for this row.
	Allow assign PVID for selected port. The range for the PVID is 1-4094.
	The PVID will be inserted into all untagged frames entering the ingress port. The
Port VID:	PVID must as same as the VLAN ID that the port belong to VLAN group, or the
	untagged traffic will be dropped.
	Enable ingress filtering for a port by checking the box. This parameter affects
	VLAN ingress processing. If ingress filtering is enabled and the ingress port is not
la succes Elles	a member of the classified VLAN of the frame, the frame is discarded.
ingress Filter:	■ Enabled
	■ Disabled
	By default, ingress filtering is disabled (no checkmark).
	Determines whether the port accepts all frames or only VLAN tagged frames.
	This parameter affects VLAN ingress processing. If the port only accepts tagged
	frames, untagged frames received on the port are discarded.
Permit Frame Type:	Options:
	■ allType
	■ tagged
	By default, the field is set to allType .

4.2.6 ONU Authorization

The ONU Authorization prevents the given Logical Link (MAC address) from registering on the GEPON. The OLT will simply ignore registration requests from the ONU in Black List. If the given ONU is already registered, the Logical Link will be deregistered, causing the ONU to depart from the network. All further requests to register from the ONU are ignored until the Host issues a White List or Non-authority command.

ONU Authorization is intended to be a temporary measure used to suspend service for reasons such as late payments or a troublesome customer. When the issue has been resolved, or the ONU has been physically removed from the network and no longer requests service, it can be removed from the Black List or add to the White List. If the ONU is still connected to the network and attempting to register, the ONU will be once again allowed onto the network.

4.4.2 Advanced Configure

Rapid Spanning Tree

The Spanning Tree protocol can be used to detect and disable network loops, and to provide backup links between switches, bridges or routers. This allows the switch to interact with other bridging devices in your network to ensure that only one route exists between any two stations on the network, and provide backup links which automatically take over when a primary link goes down. The **IEEE 802.1W Rapid Spanning Tree** Protocol allows for the blocking of links between switches that form loops within the network. When multiple links between switches are detected, a primary link is established. Duplicated links are blocked from use and become standby links. The protocol allows for the duplicate links to be used in the event of a failure of the primary link. Once the Spanning Tree Protocol is configured and enabled, primary links are established and duplicated links are blocked automatically. The reactivation of the blocked links (at the time of a primary link failure) is also accomplished automatically without operator intervention.

This automatic network reconfiguration provides maximum uptime to network users. However, the concepts of the Spanning Tree Algorithm and protocol are a complicated and complex subject and must be fully researched and understood. It is possible to cause serious degradation of the performance of the network if the Spanning Tree is incorrectly configured.

Object	Description
Location:	Selects Test Location: MAC and PHY.
Frame Number[1-100] :	Selects the vaule of frames for testing. Range from 1-100.
Payload Size [46-1500] Bytes:	Selects the vaule of Payload Size for testing. Range From 46-1500 Bytes.
VLAN Tag[0-4096]:	Selects the specific VLAN Tag ID.
Test Result:	Displays the result of loopback testing.

4.4.7 ONU IGMP Snooping

The **Internet Group Management Protocol (IGMP)** host and routers share information about multicast groups memberships. IGMP snooping is a switch feature that monitors the exchange of IGMP messages and copies them to the CPU for feature processing. The overall purpose of IGMP Snooping is to limit the forwarding of multicast frames to only ports that are a member of the multicast group.

About the Internet Group Management Protocol (IGMP) Snooping

Computers and network devices that want to receive multicast transmissions need to inform nearby routers that they will become members of a multicast group. The **Internet Group Management Protocol (IGMP)** is used to communicate this information. IGMP is also used to periodically check the multicast group for members that are no longer active. In the case where there is more than one multicast router on a sub network, one router is elected as the 'queried'. This router then keeps track of the membership of the multicast groups that have active members. The information received from IGMP is then used to determine if multicast packets should be forwarded to a given sub network or not. The router can check, using IGMP, to see if there is at least one member of a multicast group on a given subnet work. If there are no members on a sub network, packets will not be forwarded to that sub network.

Object	Description
Robust Count[0-12]:	The robust count automatically changes certain IGMP message intervals for
	IGMPv2 and IGMPv3. Increasing the robust count allows for more packet loss

	but increases the leave latency of the subnetwork.
Last Query Count[0-12] :	Number of group-specific queries sent before the router assumes there are no local members of a group. The number of queries is equal to the value of the robustness variable.
ONU Port:	This is the logical port number for this row.
IGMP Groups[0-64]:	Group of IGMP.
Multicast IP:	Displays the setting of IGMP Address.
IGMP Group Member:	Displays the IGMP members.

To force steaming multicast stream to indicate port, please clicks "Add Button" to add a static multicast address, it remains in the multicast group table, regardless of whether the multicast stream has been joined or hasn't been joined. The static multicast group will be saved to switch and it will not be released, even no one join it or even the multicast group no more streaming, unless user delete it. Please enter "IGMP IP Address", and select ports then clicks "OK Button" to add ONU's IGMP IP address and corresponding port member. (Remark: Valid IGMP IP address range should be 224.0.0.1~239.255.255.255.)

Port Map :	Allows user to select IGMP members of port.

4.4.8 ONU ACL Configure

The Access Control List (ACL) is a concept in computer security used to enforce privilege separation. It is a means of determining the appropriate access rights to a given object depending on certain aspects of the process that is making the request, principally the process's user identifier. Access Control List (ACL) is a mechanism that implements access control for a system resource by listing the identities of the system entities that are permitted or denied to access the resource. The screen in following screen appears.

4.5 How to Upgrade EPL-2000 firmware

For upgrading the EPL-2000 firmware, you need to have FTP server software. Here we are using Home FTP Server software for making example:

1. Operates the Home FTP server. The following main page will appear,

📼 Home Ftp Serv	/er					
New account	Username user	Password user	Home directory C:\Program Files\FTPEditor	Address 192.168.1.10:1024	Last time 2012/10/26 下午 (
Modify account	Anonymous			-	-	
Delete account						
Settings						
Start Server						
Stop Server						
System Log Ftp Se	erver Active Clients	File Monitoring F	ile Transfers About			
Stopped	No Clients	- TCP comman	d interface started (60997).			

Figure 4-48 Home Ftp Server main screen

2. Press the "**New account**" on the left column, the Ftp Client Editor window will appears like below picture. Please fill in the user name and password as "**user**".

ᅖ Ftp Client Editor 📃 🗖 🔀				
General Virtual Directories File Control Directory Control

Allow change directory		Allow change directory		
Allow creating directories		Allow creating directories	;	
Allow deleting directories				
Apply			Cancel	

Figure 4-49 Ftp Client Editor screen

- 3. Excutes "Start Server" for making connection establishes.
- 4. Copys the EPL-2000 firmware to the Home Ftp server directory.

For example: C:\Program Files\Home Series\Home Ftp Server

5. Operates EMS utility → clicks EPL-2000 once → excutes "Device Upgrade" on the EMS toolbar of Config.

Figure 4-50 EPL-2000 Interface screen

Figure 4-51 Device Upgrade item screen

Top Tree->EPL-2000	Upgrade Configure

	Progress Status UpgradeOk Refresh Download to Device Upgrade

Figure 4-55 Device Upgrade Procedure (4) screen

10. After finish the firmware upgarde, please reboot the EPL-2000.

5. EPL-2000 OPERATION

5.1 Address Table

The OLT switch is implemented with an address table. This address table composed of many entries. Each entry is used to store the address information of some node in network, including MAC address, port no, etc.

5.2 Learning

When one packet comes in from any port, the OLT Switch will record the source address, port no. And the other related information in address table. This information will be used to decide either forwarding or filtering for future packets.

5.3 Forwarding & Filtering

When one packet comes from some port of the Ethernet Switching, it will also check the destination address besides the source address learning. The OLT Switch will lookup the address-table for the destination address. If not found, this packet will be forwarded to all the other ports except the port, which this packet comes in. And these ports will transmit this packet to the network it connected. If found, and the destination address is located at different port from this packet comes in, the OLT Switch will forward this packet to the port where this destination address is located according to the information from address table. But, if the destination address is located at the same port with this packet comes in, then this packet will be filtered. Thereby increasing the network throughput and availability

5.4 Auto-Negotiation

The STP ports on the Switch have built-in "Auto-negotiation". This technology automatically sets the best possible bandwidth when a connection is established with another network device (usually at Power On or Reset). This is done by detect the modes and speeds at the second of both device is connected and capable of, both 10Base-T and 100Base-TX devices can connect with the port in either Half- or Full-Duplex mode.

If attached device is:	100Base-TX port will set to:
10Mbps, no auto-negotiation	10Mbps.
10Mbps, with auto-negotiation	10/20Mbps (10Base-T/Full-Duplex)
100Mbps, no auto-negotiation	100Mbps
100Mbps, with auto-negotiation	100/200Mbps (100Base-TX/Full-Duplex)

APPENDEX A

A.1 Switch's RJ-45 Pin Assignments

1000Mbps, 1000Base T

5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

Implicit implementation of the crossover function within a twisted-pair cable, or at a wiring panel, while not expressly forbidden, is beyond the scope of this standard.

A.2 10/100Mbps, 10/100Base-TX

When connecting your 10/100Mbps Ethernet Switch to another switch, a bridge or a hub, a straight or crossover cable is necessary. Each port of the Switch supports auto-MDI/MDI-X detection. That means you can directly connect the Switch to any Ethernet devices without making a crossover cable. The following table and diagram show the standard RJ-45 receptacle/ connector and their pin assignments:

	RJ-45 Connector pin assignment				
Contact	MDI	MDI-X			
	Media Dependant Interface	Media Dependant			
		Interface-Cross			
1	Tx + (transmit)	Rx + (receive)			
2	Tx - (transmit)	Rx - (receive)			
3	Rx + (receive)	Tx + (transmit)			
4, 5	Not used				
6	Rx - (receive)	Tx - (transmit)			
7, 8	Not used				

The standard cable, RJ-45 pin assignment

The standard RJ-45 receptacle/connector

There are 8 wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight cable and crossover cable connection:

Figure A-1: Straight-Through and Crossover Cable

Please make sure your connected cables are with same pin assignment and color as above picture before deploying the cables into your network.

EC Declaration of Conformity

For the following equipment:

*Type of Product	: GEPON OLT
*Model Number	: EPL-2000

* Produced by:

Manufacturer's Name:	Planet Techr	iology Corp.
Manufacturer's Address:	10F., No.96,	Minquan Rd., Xindian Dist.,
	New Taipei	City 231, Taiwan (R.O.C.)

is herewith confirmed to comply with the requirements set out in the Council Directive on the Approximation of the Laws of the Member States relating to Electromagnetic Compatibility (2004/108/EC).

For the evaluation regarding the Electromagnetic Compatibility, the following standards were applied:

EN 55022	(2010)
EN 61000-3-2	(2006 + A2: 2009)
EN 61000-3-3	(2008)
EN 55024	(2010)
EN 61000-4-2	(2009)
EN 61000-4-3	(2006 + A1: 2008)
EN 61000-4-4	(2004)
EN 61000-4-5	(2006)
EN 61000-4-6	(2009)
EN 61000-4-8	(2010)
EN 61000-4-11	(2004)
